## 2.2 Frequency applications

For a fast IGBT suitable for high frequency applications, the typical collector current vs. maximum operating frequency curve is reported. That frequency is defined as follows:

$$f_{MAX} = (P_D - P_C) / (E_{ON} + E_{OFF})$$

- The maximum power dissipation is limited by maximum junction to case thermal resistance:

### Equation 1

$$P_D = \Delta T / R_{THJ-C}$$

considering  $\Delta T = T_J - T_C = 125\text{ °C} - 75\text{ °C} = 50\text{ °C}$

- The conduction losses are:

**Equation 2**

$$P_C = I_C * V_{CE(SAT)} * \delta$$

with 50% of duty cycle,  $V_{CESAT}$  typical value @ 125 °C.

- Power dissipation during ON & OFF commutations is due to the switching frequency:

**Equation 3**

$P_{SW} = (E_{ON} + E_{OFF}) * \text{freq.}$  Typical values @ 125 °C for switching losses are used (test conditions:  $V_{CE} = 390 \text{ V}$ ,  $V_{GE} = 15 \text{ V}$ ,  $R_G = 10 \Omega$ ). Furthermore, diode recovery energy is included in the  $E_{ON}$  (see note 2), while the tail of the collector current is included in the  $E_{OFF}$  measurements (see note 3).
