# HGTG20N60A4D;FSC;TO247; Tranzystor IGBT;70A;600V;190W;RoHS 

## Dane techniczne:

Nazwa: HGTG20N60A4D
Typ: tranzystor IGBT
Napięcie kolektor-emiter: 600V
Prąd kolektora: 70A
Moc rozpraszana: 190W
Obudowa: TO247
Montaż: THT
Producent: FSC

## 600V, SMPS Series N-Channel IGBT with Anti-Parallel Hyperfast Diode

The HGTG20N60A4D is a MOS gated high voltage switching device combining the best features of MOSFETs and bipolar transistors. This device has the high input impedance of a MOSFET and the low on-state conduction loss of a bipolar transistor. The much lower on-state voltage drop varies only moderately between $25^{\circ} \mathrm{C}$ and $150^{\circ} \mathrm{C}$. The IGBT used is the development type TA49339. The diode used in anti-parallel is the development type TA49372.

This IGBT is ideal for many high voltage switching applications operating at high frequencies where low conduction losses are essential. This device has been optimized for high frequency switch mode power supplies.
Formerly Developmental Type TA49341.

## Ordering Information

| PART NUMBER | PACKAGE | BRAND |
| :--- | :--- | :--- |
| HGTG20N60A4D | TO-247 | 20N60A4D |

NOTE: When ordering, use the entire part number.

## Symbol

## Features

- >100kHz Operation At 390V, 20A
- 200 kHz Operation At 390V, 12A
- 600V Switching SOA Capability
- Typical Fall Time . . . . . . . . . . . . . . . . 55 ns at $\mathrm{T}_{\mathrm{J}}=125^{\circ} \mathrm{C}$
- Low Conduction Loss
- Temperature Compensating SABER ${ }^{\text {TM }}$ Model www.fairchildsemi.com

## Packaging

NOTE:

1. Turn-Off Energy Loss (EOFF) is defined as the integral of the instantaneous power loss starting at the trailing edge of the input pulse and ending at the point where the collector current equals zero ( $I_{C E}=0 A$ ). All devices were tested per JEDEC Standard No. 24-1 Method for Measurement of Power Device Turn-Off Switching Loss. This test method produces the true total Turn-Off Energy Loss.
2. Values for two Turn-On loss conditions are shown for the convenience of the circuit designer. E ENN is the turn-on loss of the IGBT only. E is the turn-on loss when a typical diode is used in the test circuit and the diode is at the same $T_{J}$ as the IGBT. The diode type is specified in Figure 20.

## Handling Precautions for IGBTs

Insulated Gate Bipolar Transistors are susceptible to gate-insulation damage by the electrostatic discharge of energy through the devices. When handling these devices, care should be exercised to assure that the static charge built in the handler's body capacitance is not discharged through the device. With proper handling and application procedures, however, IGBTs are currently being extensively used in production by numerous equipment manufacturers in military, industrial and consumer applications, with virtually no damage problems due to electrostatic discharge. IGBTs can be handled safely if the following basic precautions are taken:

1. Prior to assembly into a circuit, all leads should be kept shorted together either by the use of metal shorting springs or by the insertion into conductive material such as "ECCOSORBDTM LD26" or equivalent.
2. When devices are removed by hand from their carriers, the hand being used should be grounded by any suitable means - for example, with a metallic wristband.
3. Tips of soldering irons should be grounded.
4. Devices should never be inserted into or removed from circuits with power on.
5. Gate Voltage Rating - Never exceed the gate-voltage rating of $\mathrm{V}_{\mathrm{GEM}}$. Exceeding the rated $\mathrm{V}_{\mathrm{GE}}$ can result in permanent damage to the oxide layer in the gate region.
6. Gate Termination - The gates of these devices are essentially capacitors. Circuits that leave the gate opencircuited or floating should be avoided. These conditions can result in turn-on of the device due to voltage buildup on the input capacitor due to leakage currents or pickup.
7. Gate Protection - These devices do not have an internal monolithic Zener diode from gate to emitter. If gate protection is required an external Zener is recommended.

## Operating Frequency Information

Operating frequency information for a typical device (Figure 3) is presented as a guide for estimating device performance for a specific application. Other typical frequency vs collector current (ICE) plots are possible using the information shown for a typical unit in Figures 6, 7, 8, 9 and 11. The operating frequency plot (Figure 3) of a typical device shows $f_{M A X 1}$ or $f_{M A X 2}$; whichever is smaller at each point. The information is based on measurements of a typical device and is bounded by the maximum rated junction temperature.
$f_{M A X 1}$ is defined by $f_{M A X 1}=0.05 /\left(t_{d(O F F) I^{+}} t_{d(O N) I}\right)$. Deadtime (the denominator) has been arbitrarily held to 10\% of the on-state time for a $50 \%$ duty factor. Other definitions are possible. $\mathrm{t}_{\mathrm{d}(\mathrm{OFF}) \mid}$ and $\mathrm{t}_{\mathrm{d}(\mathrm{ON}) \mid}$ are defined in Figure 25. Device turn-off delay can establish an additional frequency limiting condition for an application other than $\mathrm{T}_{\mathrm{JM}} \cdot \mathrm{t}_{\mathrm{d}(\mathrm{OFF}) \mid}$ is important when controlling output ripple under a lightly loaded condition.
${ }^{f_{M A X 2}}$ is defined by $f_{\text {MAX2 }}=\left(P_{D}-P_{C}\right) /\left(E_{\text {OFF }}+E_{O N 2}\right)$. The allowable dissipation $\left(P_{D}\right)$ is defined by $P_{D}=\left(T_{J M}-T_{C}\right) / R_{\theta J C}$. The sum of device switching and conduction losses must not exceed $P_{D}$. A $50 \%$ duty factor was used (Figure 3) and the conduction losses $\left(\mathrm{P}_{\mathrm{C}}\right)$ are approximated by $\mathrm{P}_{\mathrm{C}}=\left(\mathrm{V}_{\mathrm{CE}} \times \mathrm{I}_{\mathrm{CE}}\right) / 2$.
$\mathrm{E}_{\mathrm{ON} 2}$ and $\mathrm{E}_{\mathrm{OFF}}$ are defined in the switching waveforms shown in Figure 25. EON2 is the integral of the instantaneous power loss ( $\mathrm{I}_{\mathrm{CE}} \times \mathrm{V}_{\mathrm{CE}}$ ) during turn-on and $E_{\text {OFF }}$ is the integral of the instantaneous power loss (ICE $\times \mathrm{V}_{\mathrm{CE}}$ ) during turn-off. All tail losses are included in the calculation for E EFF; i.e., the collector current equals zero (ICE = 0).

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
